ABSTRACT

In response to recent concern about geographical illiteracy, a survey designed to determine specific knowledge about the locations of bodies of water, countries, and cities was distributed to 158 elementary education majors at the University of South Dakota (Vermillion). The results of the survey revealed: (1) only 65 percent correctly located the bodies of water; (2) only 41 percent correctly located the countries; (3) only 30 percent correctly located the cities; and (4) males scored slightly higher than females. The appendices include the survey test, the corresponding maps, and the instructions for administering the survey. Statistical tables are also included. (DJC)

Geographical Knowledge of
University Elementary Education Majors

According to a recent news article, when over 1800 college students in North Carolina were asked to locate the Seine River, only a third of them knew it was in France. Of Freshmen tested at St. Mary-of-the-Woods College in Indiana, ninety-five percent could not locate Vietnam on a map. In north Dallas, one out of five twelve-year-olds mistook Brazil for the United States on a map of the world (Solorzano, 1985). These findings are not unlike those of a study done in 1982 by the Association of American Geographers which was given to 3000 students at 185 colleges and universities. In this survey of basic geographical knowledge, college seniors missed half the questions. The final report of this study, "Geography and International Knowledge," concluded that Americans' knowledge of basic geography is appallingly low (Shabad, 1982).

National organizations are also alarmed at the lack of geographical knowledge possessed by students on all levels of education. The National Geographic Society and the Southern Governors' Association have both prepared documents concerning the lack of geographical and international awareness.

Today there is a general movement to correct what is perceived as a lack of global perspective in our society. Educational reformers increasingly call for more study of

geography, more attention to the ultimate benefits of foreign languages, and more international content throughout the curriculum. Knowing our international neighbors is becoming a priority item to many Americans.

Before curricular changes can be made it is essential that educators have base-line information on the status of geographical knowledge possessed by their students. This was the case at The University of South Dakota. Data were missing on the number of students who had taken a high school geography course and the knowledge of locations of water bodies, countries, and cities held by these students. The time was right to conduct a geographical knowledge survey of selected elementary education students at The University of South Dakota.

Research Procedures

A geography survey designed to determine specific knowledge about the locations of bodies of water, countries, and cities was created by modifying a geography test which appeared in ACCESS (1987, pp. 8,9). The original test was one in which lists of bodies of water, countries and cities were used. In the modified version of the test used in this study most of the same water bodies, countries, and cities were used but two maps were used instead of one so that test-takers could read them more easily. One map was used for identifying cities while the second one was used for identifying bodies of water and countries. A brief biographical data section was incorporated into the beginning of

the survey.

With the help of School of Education faculty the survey was administered to 158 students enrolled in selected elementary education methods courses at The University of South Dakota. A step-by-step instruction sheet was provided for all instructors administering the survey in their classes. The instructions were to be read to the students to ensure administration procedures were standardized with all classes. The students completed the survey in September, 1987, the data were entered into the University computer and the findings were analyzed.

Results

Table 1 reflects an overall analysis of the geography survey, giving the average percentage correct in each of the three location categories (water, country, city) for the total sample of students completing the survey. For the location of ten water bodies, the mean response rate was sixty-three percent. Of the locations of thirty-three countries, the mean response was forty-one percent correct, while for the thirty-three cities a mean response rate of thirty-three percent was achieved by the students.

Insert Table 1 about here

Student responses were analyzed by a two-way analysis of variance, with male/female responses as one independent variable, and the other independent variable being whether or not students

had taken a high-school geography class. Three two-by-two analyses were conducted to determine the interaction effects of the two independent variables, sex and geography class, with each of the three location categories, water, country, and city. Table 2 shows correct responses by male/female mean scores for water bodies, countries and cities. Scores for each of the categories were significantly different in favor of males. The level of interaction effect between the independent variables was not significant.

Insert Table 2 about here

Table 3 reports the means of the correct responses by geography class/no geography class for locating water bodies, countries and cities. There were no significant differences between any of the mean scores. Levels of interaction effects between geography class and sex on ability to locate water bodies, countries or cities were not significant.

Insert Table 3 about here

Analysis of variance (ANOVA) results are presented in Tables 4, 5, and 6, for the dependent variables, water bodies, countries and cities respectively. In none of the three tables does the level of the interaction effect between sex and geography class yield a significant value.

Conclusions

If 70 percent is regarded as a passing grade at the college/university level then the students in this study failed in their knowledge of locations of water bodies, countries, and cities. The highest mean correct response was 63 percent for locations of water bodies. The locations of countries was a distant second with a mean response rate of 41 percent. Locations of cities was the lowest of the three categories with a mean response of 33 percent. These scores are appallingly low.

The study indicates there is no significant difference between those students who have had a geography class in high school and those who have not. The mean of correct responses of locations of water bodies for those who have had a geography class is 65 percent, not usually considered a passing score. Those who had a geography class scored 41 percent in locating countries and scored 30 percent in locating cities. These are hardly scores in which we can take great pride.

Males did have an edge over females with significantly higher

mean values in locating water bodies, countries and cities. However, once again, these mean value scores were not impressive. Scores on two of the three categories would have been considered failing by most standards.

It may not be crucial that an individual know the specific location of a water body, country, or city, but may we not draw a corollary to suppose that this individual probably doesn't know much about the water bodies, countries, or cities in general. Ignorance of basic geography points toward a nonchalance regarding world affairs in general. And therein lies a serious problem for our nation.

APPENDIX A

Geography Survey Response Sheet

GEOGRAPHY SURVEY

PART I. Please check the appropriate response to each question.

1. Year in School? ___ Freshman, ___ Sophomore, ___ Junior, ___ Senior
2. Sex? ___ Male, ___ Female
3. Have you had a geography course in high school? ___ Yes, ___ No
4. Have you had a geography course in college? ___ Yes, ___ No

PART II. Match each number on the map with the specific body of water, country, or city listed below. Numbers 1-10 on Map 1 are water areas, numbers 11-43 on Map 1 are countries, and numbers 44-76 on Map 2 are cities. Write the number before the correct response

Water Bodies (numbers 1-10)

- | | |
|------------------------|-------------------|
| ___ Indian Ocean | ___ North Sea |
| ___ Bering Sea | ___ Persian Gulf |
| ___ Strait of Magellan | ___ Pacific Ocean |
| ___ Mediterranean Sea | ___ Coral Sea |
| ___ Atlantic Ocean | ___ Caribbean Sea |

Countries (numbers 11-43)

- | | |
|--------------------------------|------------------|
| ___ East Germany | ___ Angola |
| ___ Brazil | ___ Niger |
| ___ Spain | ___ Zaire |
| ___ Saudi Arabia | ___ South Africa |
| ___ Poland | ___ Lesotho |
| ___ Yugoslavia | ___ Ethiopia |
| ___ Mongolia | ___ Libya |
| ___ Turkey | ___ Egypt |
| ___ Iran | ___ Peru |
| ___ Indonesia | ___ Columbia |
| ___ Thailand | ___ Canada |
| ___ Vietnam | ___ Honduras |
| ___ Syria | ___ Nicaragua |
| ___ Afghanistan | ___ Costa Rica |
| ___ People's Republic of China | ___ Cuba |
| ___ Korea | ___ Iraq |
| ___ New Zealand | |

Cities (numbers 44-76)

- | | |
|-----------------|--------------------|
| ___ Chicago | ___ Tripoli |
| ___ Leningrad | ___ Nairobi |
| ___ Rome | ___ Casablanca |
| ___ Berlin | ___ Buenos Aires |
| ___ Moscow | ___ Caracas |
| ___ Cairo | ___ Lima |
| ___ Damascus | ___ Montreal |
| ___ Tehran | ___ Halifax |
| ___ Beirut | ___ Winnipeg |
| ___ Delhi | ___ San Salvador |
| ___ Phnom Penh | ___ Mexico City |
| ___ Ulaanbattar | ___ Managua |
| ___ Beijing | ___ Mecca |
| ___ Shanghai | ___ Rio De Janeiro |
| ___ Hong Kong | ___ Christchurch |
| ___ Manila | ___ Melbourne |
| ___ Kinshasa | |

APPENDIX B

Map 1. Water Bodies and Countries

Map 1. Water Bodies and Countries

APPENDIX C

Map 2. Cities

APPENDIX D

Instructions for Administering Geography Survey

Instructions for Administering Geography Survey

1. Explain that this survey is measuring geographic locations of water bodies, countries, and cities around the world.
2. Each student should receive one answer sheet and two different maps. Map 1 has numbers on it which represent water bodies and countries. Map 2 has numbers which represent cities.
3. Please explain the procedures carefully.

Procedure 1. Complete the demographic information at the top of the answer sheet. Do not place your name on this sheet.

Procedure 2. Explain the maps and the answer sheet. Map 1 has a series of numbers which represent water bodies and countries. Numbers 1-10 on Map 1 are water bodies and numbers 11-43 are countries. The students are to write the number before the correct response on the answer sheet. (Example: Locate number 1 on Map 1. Number 1 is the Pacific Ocean. Students would write number 1 before Pacific Ocean on the answer sheet.) Map 2 has a series of numbers representing cities around the world and should be completed following the same procedures as on Map 1.

Procedure 3. The student may separate the answer sheet from the maps to make it easier to complete the survey.

Procedure 4. Students can now begin taking the survey. This survey should take approximately 20 minutes to complete. More time can be given if needed.

Procedure 5. When the students complete the survey, they are to turn in the answer sheet and both maps. We do not want these items out among students as several classes at differing time periods will be taking this survey.

Procedure 6. Please turn the materials back to the individual who initially gave them to you.

THANK YOU FOR YOUR COOPERATION IN MAKING THIS STUDY POSSIBLE!
